Usage

The filter recognizes code blocks with the emphasize attribute present:

```
```{.haskell emphasize=2:3-2:14,3:3-3:12}
myFunc = do
 newStuffHere
 andThisToo notThis
 notSoRelevant
```
```

Syntax

The value of the emphasize attribute is a comma-separated list of ranges. Each range is two positions, separated by a dash. A position is a line number, followed by a colon, ending with a column number. The syntax can be described in EBNF, like so:

```
line = natural number;
column = natural number;
position = line, ":", column;
```

```
range = position, "-", position;
ranges = range, { (",", range) };

(* definition of natural number excluded for brevity *)
```

Rendering to HTML

The code block above would render the following HTML output:

```
<code>myFunc = do
  <em>newStuffHere</em>
  <em>andThisToo</em> notThis
  notSoRelevant</code>
```

When rendering to HTML, the markup can be styled using CSS:

```
code em {
  color: red;
  font-style: italic;
}
```

By default, if no custom styling is applied, it will look something like this:

```
myFunc = do
  newStuffHere
  andThisToo notThis
  notSoRelevant
```

Note that the there is no additional syntax highlighting when emphasizing code and rendering to HTML, as there is no way to use Pandoc's highlighter and embed custom HTML tags. You might be able to add that using a Javascript highlighter running on the client.

Rendering with LaTeX

When rendering using LaTeX, two things are required:

- The listings package needs to be included.
- You need to define a CodeEmphasis command, styling the emphasized code in lstlistings.

If you're not using a custom LaTeX template, you can use the YAML front matter in a Markdown source file to add the requirements:

header-includes:

- \usepackage{listings}
- \lstset{basicstyle=\ttfamily}
- \newcommand{\CodeEmphasis}[1]{\textcolor{red}{\textit{#1}}}

NOTE: When rendering as Beamer slides, any frame including an emphasized block must be marked as **fragile**:

```
## My Slide {.fragile}

```{.haskell emphasize=2:3-2:14,3:3-3:12}
myFunc = do
 newStuffHere
 andThisToo notThis
 notSoRelevant
```
```

Regular Highlighting

```
You can still use regular Pandoc highlighting (the skylighting library):

'`` {.css}
.hello {
 world: yes;
}
...
It gives you all the nice colors:
.hello {
 world: yes;
```

The drawback is that you have two different highlighting systems now, one for emphasized code, one for regular code blocks.

Install

Executables for Linux and macOS are available in the Releases page.

From Hackage

If you'd rather install using cabal or stack, you can use the following command: cabal install pandoc-emphasize-code

The package is available at Hackage.

Build

Requirements:

• Cabal or Stack, either works.

To install from sources, run:

```
git clone git@github.com:owickstrom/pandoc-emphasize-code.git
cd pandoc-emphasize-code
stack setup
stack install
```

Run

If you have installed from sources, and you have ~/.local/bin on your PATH, you can use the filter with Pandoc like so:

```
pandoc --filter pandoc-emphasize-code input.md output.html
```

Changelog

- 0.1.0
 - First release
 - Support for multiple ranges
 - Rendering support for HTML, Markdown, and LaTeX
